

### **Running time of pi-protocol using multiple lambda values**

The following table contains the time taken to run the  $\pi$  protocol. The protocol is implemented using shared variable. The correctness of the protocol is determined by matching the map function value of C+D and XORs of shares of three servers.

Sr. No.	$\lambda$ (bits)	Time (msec)
1	64	97.77
2	64	100.87
3	64	103.82
1	128	178.09
2	128	177.23
3	128	179.85
1	256	342.83
2	256	327.89
3	256	329.37
